

## ABSTRACT

**Augmenting Sets of Image Recordings**

- 5 A method is provided for augmenting a set of image recordings in which, in addition to making image recordings (95), location data (175) is recorded for locations for which the user desires an, or a further, image recording. This desired-image-recording location data is subsequently used to retrieve one or more corresponding image recordings from a service system (40).

10

(Fig. 17)

FIG. 17 is a block diagram of a system for augmenting sets of image recordings. The system includes a user device 100, a service system 40, and a location data recording module 175. The user device 100 is connected to the service system 40 via a network 110. The location data recording module 175 is connected to the user device 100 and the service system 40. The location data recording module 175 is configured to record location data (175) for locations for which the user desires an, or a further, image recording. The location data recording module 175 is also configured to use the location data (175) to retrieve one or more corresponding image recordings from the service system 40.
